VALUE(15:8)							
7	6	5	4	3	2	1	0
VALUE(7:0)							

VALUE (15:0)	Grab LinePitch
RW	This is the line pitch when writing in ram. It is measured in bytes, not pixels.
Value at Reset:	0x0

Address: section "DMA" base address + 0x024

Description:

Host Line Size Register.

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved		VALUE(13:8)					
7	6	5	4	3	2	1	0
VALUE(7:0)							

VALUE (13:0) <i>RW</i>	Host Line size	
	<p>This is the line size when writing in host ram. It is measured in bytes, not pixels. If this register is higher than the actual data provided by the sensor, stray data will be written into host memory. If this register is lower than the data provided by the sensor, image data will be cropped at the end of the line.</p> <p>For backward compatibility, the value of 0 indicates that the FPGA should auto-compute the line sized based on data provided by the sensor interface.</p>	
Value at Reset:	0x0	
Possible Values:	0x1 - 0x3FFF	Written line size in host frame.
	0x0	Auto-compute line size from sensor data.

Address: section "DMA" base address + 0x028

Reserved						REVERSE_Y	REVERSE_X
7	6	5	4	3	2	1	0
Reserved							

COLOR_SPACE (2:0)		
<i>RW</i>	Output color space used to transfer data to the DMA engine.	
Value at Reset:	0x0	
Possible Values:	0x0	Reserved for Mono sensor operation
	0x1	BGR32
	0x2	YUV 4:2:2 in full range
	0x3	Planar 8-bits
	0x4	Reserved for Y only with color sensor
	0x5	RAW color pixels (8bpp or 10bpp selected with MONO10 registor)

DUP_LAST_LINE		
<i>RW</i>	This field is used to enable the duplicate last line feature. When turned on, the datapath will regenerate the last line when it receives the end of frame marker from the acquisition section. The goal of this feature is to compensate for the lost line during the Bayer demosaic processing.	
Value at Reset:	0x0	
Possible Values:	0x0	normal processing
	0x1	last line is duplicated

REVERSE_Y	REVERSE Y	
<i>RW</i>	Reverse readout	
Value at Reset:	0x0	
Possible Values:	0x0	Bottom to top readout
	0x1	Top to bottom readout

REVERSE_X		
<i>RW</i>		
Value at Reset:	0x0	

Section: ACQ

Address Range: [0x100 - 0x2CC]

GRAB_CTRL

GRAB ConTRoL Register

Address: section "ACQ" base address + 0x000

Description:

Grag Control Register

31	30	29	28	27	26	25	24
RESET_GRAB	Reserved	GRAB_ROI2_EN	ABORT_GRAB	Reserved			
23	22	21	20	19	18	17	16
Reserved							TRIGGER_O VERLAP_BUFn
15	14	13	12	11	10	9	8
TRIGGER_O VERLAP	TRIGGER_ACT(2:0)			Reserved	TRIGGER_SRC(2:0)		
7	6	5	4	3	2	1	0
Reserved			GRAB_SS	Reserved		BUFFER_ID	GRAB_CMD

RESET_GRAB <i>RW</i>		
	This register resets the entire python_ctrl.	
Value at Reset:	0x0	
Possible Values:	0x0	Reset not active
	0x1	Reset active

GRAB_ROI2_EN <i>RW</i>		
	Enable the second ROI on the frame (KNS). This register is not DB. 1) No Y overlap is allowed 2) Xsize must be the same for the two ROI for the moment(DMA constraint). 3) EOF and SOF in between the two in-frame ROIs will be masked to the DMA. The DMA will see one frame, with the two ROI inside.	
Value at Reset:	0x0	
Possible Values:	0x0	Dual ROI disable
	0x1	Dual ROI enable

ABORT_GRAB <i>WO/AutoClr</i>	ABORT GRAB	
	This is the grab Abort signal, it will reset all the grab queued.	
Possible Values:	0x0	Normal operation
	0x1	Reset Grab

TRIGGER_OVERLAP_BUF Fn <i>RW</i>		
	NOT FULLY VALIDATED. DON'T USE. SET IT TO '0'.	
Value at Reset:	0x0	
Possible Values:	0x0	Buffer the trigger received during the dead window in PET mode and execute
	0x1	The trigger will be ignored during dead window in PET mode.

TRIGGER_OVERLAP <i>RW</i>		
	This field enables the trigger overlap. In this mode the exposure and the readout of the sensor can be done in parallel for higher framerates.	
Value at Reset:	0x1	
Possible Values:	0x0	Trigger Overlap disable
	0x1	Trigger Overlap enable (default)

TRIGGER_ACT (2:0) <i>RW</i>	TRIGGER ACTivation	
	<p>This is the trigger activation . This register selects the activation of the trigger when the trigger source is set to Hardware Snapshot mode . This register is Double Buffered, so the trigger activation may change from one grab command to another.</p> <p>In activation Level HI/LO with EXPOSURE_MODE register set to Timed, the camera will be triggered in continuous way if the level of the external trigger remains at the LEVEL programmed in this register.</p> <p>In activation Level HI/LO with EXPOSURE_MODE register set to Trigger Width, the Exposure time will be set by the level of the trigger input. The FPGA exposure regsiters will be ignored. The Dual and Triple slope are not supported in the mode.</p>	
Value at Reset:	0x0	
Possible Values:	0x0	Rising edge
	0x1	Falling edge
	0x2	Rising or Falling edge
	0x3	Level HI
	0x4	Level LO
	0x5	RESERVED
	0x6	RESERVED
	0x7	RESERVED

TRIGGER_SRC (2:0) <i>RW</i>	TRIGGER SouRCe	
	<p>This is the trigger source. This register selects the source of the grab trigger. This register is Double Buffered, so the trigger source may change from one grab command to another. TRIGGER_SRC(1) may be seen as a TRIGGER_STATE by the software driver.</p>	
Value at Reset:	0x0	
Possible Values:	0x0	RESERVED
	0x1	Immediate mode (Continuous)
	0x2	Hardware Snapshot mode
	0x3	Software Snapshot mode
	0x4	SFNC mode (auto trig)

GRAB_SS <i>WO/AutoClr</i>	GRAB Software Snapshot	
	This is the software snapshot register when the trigger source selected is Software Snapshot mode.	
Possible Values:	0x0	Idle
	0x1	Start a grab

BUFFER_ID <i>RW</i>		
	This is the ID of the DMA parameters to associate with this grab command.	
Value at Reset:	0x0	

GRAB_CMD <i>WO/AutoClr</i>	GRAB CoMmanD	
	<p>This is MIL GRAB command.</p> <p>When the trigger source is set to Immediate mode(Continuous), an exposure sequence will be automatically executed. When the trigger source is set to Software Snapshot mode or Hardware Snapshot mode, GRAB_CMD will act as an ARM.</p> <p>The GRAB_CMD will take around 13 clks to record the grab parameters to the SPI fifo. The GRAB_CMD_DONE register may be read to avoid fifo corruption before sending another Grab command instruction.</p>	
Possible Values:	0x0	Idle
	0x1	Start grab command

GRAB_STAT

Address: section "ACQ" base address + 0x008

31	30	29	28	27	26	25	24
GRAB_CMD_DONE	ABORT_PET	ABORT_DELA I	ABORT_DONE E	Reserved		TRIGGER_RDY

Reserved	GRAB_FOT	GRAB_READ OUT	GRAB_EXPO SURE	Reserved	GRAB_PEND ING	GRAB_ACTI VE	GRAB_IDLE

GRAB_CMD_DONE <i>RO</i>	GRAB CoMmanD DONE						
	The GRAB_CMD will take around 13 clks to reccord the grab parametters to the SPI fifo. This register may be readed to avoid fifo corruption before sending another Grab command instruction.						
Possible Values:	0x0		Grab Command in process				
	0x1		Grab command idle				

ABORT_PET <i>RO</i>	ABORT during PET						
	This is the ABORT PET flag. It is set to '1' when an abort is detected in the PETengin phase of the trigger. It is set back to '0' when ABORT_DONE is set to '1'.						
Possible Values:	0x0		Abort in PET Phase idle				
	0x1		Abort in PET Phase active				

ABORT_DELA <i>RO</i>							
	This is the ABORT DELAI flag. It is set to '1' when an abort is detected in the delai phase of the trigger. It is set back to '0' when ABORT_DONE is set to '1'.						
Possible Values:	0x0		Abort in Delai Phase idle				
	0x1		Abort in Delai Phase active				

ABORT_DONE <i>RO</i>	ABORT is DONE						
	This read-only field indicates the RESET_GRAB command status. If 0, an abort sequence is executing.						
Possible Values:	0x0		Abort sequence not finished yet				
	0x1		Abort DONE, or not started (reset value)				

TRIGGER_RDY <i>RO</i>							

ABORT_MNGR_STAT (2:0) <i>RO</i>							
	DEBUG ABORT MANAGER STATE MACHINE						

TRIG_MNGR_STAT (3:0)	
<i>RO</i>	DEBUG TRIGGER MANAGER STATE MACHINE

TIMER_MNGR_STAT (2:0)	
<i>RO</i>	DEBUG TIMER MANAGER STATE MACHINE

GRAB_MNGR_STAT (3:0)	
<i>RO</i>	DEBUG GRAB MANAGER STATE MACHINE

GRAB_FOT	GRAB Field Overhead Time	
<i>RO</i>	This is the sensor FOT (Field Overhead Time).	
Possible Values:	0x0	Not in FOT
	0x1	In FOT

GRAB_READOUT		
<i>RO</i>	This is the sensor readout status. It goes to '1' on the SO_FOT and goes to '0' when the datapath decoder decodes the end of frame.	

GRAB_EXPOSURE		
<i>RO</i>	This is the sensor integration status	
Possible Values:	0x0	Idle
	0x1	Integrating

GRAB_PENDING		
<i>RO</i>	Grab pending status. When this register is set to one, a second grab command is queued in the fpga.	
Possible Values:	0x0	No grab pending
	0x1	Grab pending

GRAB_ACTIVE		
<i>RO</i>	Grab active status. When this register is set to one, at least one grab command has been received.	

GRAB_IDLE		
<i>RO</i>	GRAB IDLE status. When this register is set to '1', The grab engin is in idle state.	
Possible Values:	0x0	Grab is in process
	0x1	Grab is Idle

READOUT_CFG1

FOT_LENGTH(7:0)							

FOT_LENGTH_LINE (4:0)	Frame Overhead Time LENGTH LINE	
<i>RW</i>	This is the length of the Frame Overhead Time in line_time unit.	
Value at Reset:	0x0	
Possible Values:	Any Value	Any 16 bit value

EO_FOT_SEL		
<i>RW</i>	This selector selects who will generate the EO_FOT in the controller. When select 0, the EO_FOT is the falling edge detection of the monitor FOT. When select 1, the EO_FOT will be generated inside the controller with programmed FOT_LENGTH.	
Value at Reset:	0x0	

FOT_LENGTH (15:0)	Frame Overhead Time LENGTH	
<i>RW</i>	This is the length of the Frame Overhead Time. This register is defined as number of lines. It is used when EO_FOT_SEL is set to 1.	
Value at Reset:	0x0	
Possible Values:	Any Value	Any 16 bit value

READOUT_LENGTH(7:0)							

READOUT_LENGTH (28:0) RO		
	This is the readout length register. This register is calculated by the FPGA in the IRIS4 projectand gives the readout lenght without the FOT. This register will depend on the ROI, and Subsampling mode. It is used in the PET engin calculations. In Sys_Clock domain.	
Possible Values:	Any Value	Any 24 bits value

READOUT_CFG3

EXPOSURE_SS(7:0)							

EXPOSURE_LEV_MODE	EXPOSURE LEVel MODE	
<i>RW</i>	This is the exposure level mode selector. When selecting the TRIGGER ACTIVATION = Level Mode, this register selects the exposure method used. When this register is set to '0' the timed mode is selected; Register EXPOSURE_SS is used for the exposure time. When this register is set to '1' the external trigger width is used for the exposure time.	
Value at Reset:	0x0	
Possible Values:	0x0	Timed Mode
	0x1	Trigger Width

EXPOSURE_SS (27:0)	EXPOSURE Single Slope	
<i>RW</i>	This is the total exposure time in single/dual/triple slope mode.	
	This register is double buffered.	
Value at Reset:	0x0	
Possible Values:	Any Value	Any 28 bits value

STROBE_START(15:8)							
7	6	5	4	3	2	1	0
STROBE_START(7:0)							

STROBE_E <i>RW</i>	STROBE Enable	
	This register enables the strobe logic.	
	For Nexis 3 systems, to enable STROBE_A signal, STROBE_E and STROBE_A_EN must be enabled. For Nexis 3 systems, to enable STROBE_B signal, STROBE_E and STROBE_B_EN must be enabled.	
	For Nexis 3 systems, STROBE_A and STROBE B can be activated at the same time, in this case the two strobes will be the same as they share the same programming.	
	This register is double buffered	
Value at Reset:	0x0	
Possible Values:	0x0	Strobe disabled
	0x1	Strobe enabled

STROBE_POL <i>RW</i>	STROBE POLarity	
	This is the strobe polarity at the pin of the FPGA only for GTR systems.	
	For NEXIS3 systems use register ANPUT\IO\IO_OUT_POL\OUTx_POL	
	This register is not double buffered.	
Value at Reset:	0x0	
Possible Values:	0x0	Active high strobe
	0x1	Active low strobe

STROBE_START (27:0) <i>RW</i>	STROBE START	
	This is the strobe start location. This location depends on the Strobe Mode used.	
	In Strobe Mode='0', the start of the strobe is situated during the exposure time. In Strobe Mode='1', the start of the strobe is situated during the trigger delay.	
	This register is double buffered	
Value at Reset:	0x0	
Possible Values:	Any Value	Any 28 bits value

STROBE_END(15:8)							
7	6	5	4	3	2	1	0
STROBE_END(7:0)							

STROBE_MODE <i>RW</i>	STROBE MODE	
	This register selects the location of the Strobe Start.	
	When this register is set to 0, the STROBE_START register is located during the exposure timer.	
	When this register is set to 1, the STROBE_START register is located during the trigger delay timer.	
	In HW level mode the strobe mode must be set to STROBE MODE=0 since the trigger cannot be delayed.	
	This register is double buffered	
Value at Reset:	0x0	
Possible Values:	0x0	Strobe start during exposure
	0x1	Strobe start during trigger delay

STROBE_B_EN <i>RW</i>	STROBE phase B ENable	
	This field enables the generation of STROBE_B signal, for a NEXIS 3 system.	
	This register is double buffered to support back2back mode in nexis systems.	
Value at Reset:	0x0	
Possible Values:	0x0	Enable Strobe B
	0x1	Disable Strobe B

STROBE_A_EN <i>RW</i>	STROBE phase A ENable	
	This field enables the generation of STROBE_A signal(Default strobe), for a NEXIS 3 system.	
	This register is double buffered to support back2back mode in nexis systems.	
Value at Reset:	0x1	
Possible Values:	0x0	Enable Strobe A (default strobe)
	0x1	Disable Strobe A

STROBE_END (27:0) <i>RW</i>	STROBE END	
	This is the strobe end location. This location does not depend on the Strobe Mode used.	
	This register is double buffered	
Value at Reset:	0xffffffff	
Possible Values:	Any Value	Any 28 bits value

SER_RWn	SERial Read/Writen	
<i>RW</i>	This register configures the type of the serial access to the CMOS sensor	
Value at Reset:	0x1	
Possible Values:	0x0	Write access
	0x1	Read access

SER_CMD (1:0)	SERial CoMmand	
<i>RW</i>	This is the type of command sent to the serial fifo.	
	To access the Sensor, write SER_WF_SS=1 with SER_CMD=0x0, with the parametters: SER_WRn, SER_ADD(8:0) and SER_DAT(15:0).	
	To insert a timer between fifo commands, write SER_WF_SS=1 with SER_CMD=0x1, with the parameter: SER_DAT(15:0). The value of the timer inserted is calculated with the following formula: $\text{Timer} = \text{SER_DAT}(15:0) * 1024 * \text{SYS_PERIOD}$, SYS_PERIOD is 1/62.5mhz. The granularity of the timer is 16.384us	
	To insert a Stop separator command, write SER_WF_SS=1 with SER_CMD=0x3. When the read logic encounter this command, it will stop read from the fifo until a new SER_RF_SS is received.	
Value at Reset:	0x0	
Possible Values:	0x0	CMOS sensor access COMMAND
	0x1	Insert timer COMMAND
	0x2	STOP separator COMMAND
	0x3	RESERVED

SER_RF_SS	SERial Read Fifo SnapShot	
<i>WO/AutoClr</i>	This is the read fifo snapshot. When the read fifo logic receives this snapshot, it will read all the fifo comands until a STOP separator command is read or Empty fifo is detected.	
Possible Values:	0x0	Idle
	0x1	Start Read FIFO

SER_WF_SS	SERial Write Fifo SnapShot	
<i>WO/AutoClr</i>	When the system toggle this bit, the address, data and command are wrote to the command fifo. This fifo can contain the entire dcf, so the driver will not need to pool the status bit. This is a auto reset bit register, so after the driver write one, the bit will be auto reset to 0. To start the FIFO read logic write '1' to regsiter SER_RF_SS.	
Possible Values:	0x0	Idle
	0x1	Write a command to the FIFO

SENSOR_REFRESH_TEMP <i>WO/AutoClr</i>	SENSOR REFRESH TEMPerature						
	This register starts a sensor temperature read on the serial interface of the Python sensor. The temperature value readed will be available on field SENSOR_TEMP when field SENSOR_TEMP_VALID is set to '1'. [Pas utilise pour le moment dans IRIS4]						
Possible Values:	0x0	Idle					
	0x1	Starts a Temperature read on Python SPI interface					

SENSOR_POWERDOWN <i>WO/AutoClr</i>							
	After a PowerUp sequence(SESOR_POWERUP_DONE=1), successfull or not, this register can reset the clock oscillator and enable the reset to the sensor. This power down don't do power sequencing.						

SENSOR_COLOR <i>RW</i>	SENSOR COLOR						
	This register informs the datapath logic that a color sensor is used. This information is needed for the remapper logic.						
Value at Reset:	0x0						
Possible Values:	0x0	Monochrome sensor					
	0x1	Color sensor					

SENSOR_REG_UPDATE <i>RW</i>	SENSOR REGister UPDATE						
	By setting this bit to 1, the SENSOR CONTROLLER WILL UPDATE the programed CMOS sensor registers at the beginning of each grab.						
Value at Reset:	0x1						
Possible Values:	0x0	Do not update registers					
	0x1	Update registers					

SENSOR_RESETN	SENSOR RESET Not	
<i>RW</i>	After a successfull PowerUP sequence, writing this field to '0' reset the Python CMOS sensor.	
Value at Reset:	0x1	
Possible Values:	0x0	Reset the sensor after a successfull powerUP
	0x1	Nothing

SENSOR_POWERUP		
<i>WO/AutoClr</i>	This register Enables the clk oscillator and removes the reset from the sensor.	
Possible Values:	0x0	idle
	0x1	Start the power sequence

Address: section "ACQ" base address + 0x098

SENSOR_TEMP (7:0) <i>RO</i>							
	This register gives the Temperature of the Python sensor after a SENSOR_REFRESH_TEMP snapshot. The field SENSOR_TEMP_VALID indicates when the SENSOR_TEMP value is valid. [Pas utilise pour le moment dans IRIS4]						
Possible Values:	Any Value						

SENSOR_TEMP_VALID <i>RO</i>	SENSOR TEMPerature VALID						
	This field indicates that the field SENSOR_TEMP have valid temperature after a SENSOR_REFRESH_TEMP snapshot. [Pas utilise pour le moment dans IRIS4]						
Possible Values:	0x0	SENSOR_TEMPERATURE register is not valid					
	0x1	SENSOR_TEMPERATURE register is valid					

SENSOR_POWERDOWN <i>RO</i>							
	This field indicates that the sensor is in powerdown state.						
Possible Values:	0x0	Not in powerdown state					
	0x1	Powerdown					

SENSOR_RESETN <i>RO</i>	SENSOR RESET N						
	This is the sensor RESETN status.						
Possible Values:	0x0	In reset state					
	0x1	Not in reset					

SENSOR_OSC_EN <i>RO</i>	SENSOR OSCILLATOR ENable						
	This is the sensor oscillator enable status.						
Possible Values:	0x0	Disable					
	0x1	Enable					

SENSOR_VCC_PG <i>RO</i>	SENSOR supply VCC Power Good	
	This is the VCC Power Good status (generated by external HW).	
	[TO BE DELETED, waiting for ON SEMI INFORMATION]	
Possible Values:	0x0	Disable
	0x1	Enable

SENSOR_POWERUP_STAT <i>RO</i>		
	When a powerup sequence is finish, this register indicates the result of the POWERUP sequence.	
Possible Values:	0x0	PowerUp sequence fail
	0x1	PowerUp sequence success

SENSOR_POWERUP_DONE <i>RO</i>		
	This register indicates that the POWERUP sequence is finish. Read register SENSOR_POWERUP_STAT to see the result.	
Possible Values:	0x0	PowerUp sequence not started
	0x1	PowerUp sequence finish

CONTRAST_OFFSET(7:0)							

CONTRAST_GAIN (11:0)	
<i>RW</i>	This is a digital gain [4].[8] applied after the EXIT_CP3 subtractor. This register MUST be set to 1 or greater.
Value at Reset:	0x100

CONTRAST_OFFSET (7:0)	CONTRAST OFFSET
<i>RW</i>	This is the constant subtracted to the 10 bit pixel FPN and PRNU corrected. The value is a 8 bits integer value [8].[0] . This register is aligned with the LSB of the 10 bit pixel value.
Value at Reset:	0x0

FPN_ACC_ADD

7	6	5	4	3	2	1	0
FPN_ACC_ADD(7:0)							

FPN_ACC_MODE_SEL <i>RW</i>							
	<p>This register selects if the Contrast Gain and Offset is used for compute the pixel accumulators.</p> <p>If FPN_ACC_MODE_SEL =0 then the module will use CONTRAST_GAIN=1 and CONTRAST_OFFSET=0 for the accumulators.</p> <p>If FPN_ACC_MODE_SEL =1 then the module will use Gain and Offset from registers CONTRAST_GAIN and CONTRAST_OFFSET.</p>						
Value at Reset:	0x0						
Possible Values:	0x0	Don't use Contrast Gain and Offset					
	0x1	Use Contrast Gain and Offset					

FPN_ACC_MODE_EN <i>RW</i>	FPN ACCumulator MODE ENable						
	This field defines the accumulator mode. When this register is set to '1', the accumulators will start count and no frame will be sent to the host memory.						
Value at Reset:	0x0						
Possible Values:	0x0	Normal DMA transfert mode					
	0x1	Accumulator mode					

FPN_ACC_R_SS <i>WO/AutoClr</i>	FPN ACCumulator Read Snapshot						
	This is the column read accumulator snapshot.						

FPN_ACC_ADD (11:0) <i>RW</i>	FPN ACCumulator ADDress						
	This is the column accumulator adress to read.						
Value at Reset:	0x0						

FPN_ACC_DATA

Address: section "DATA" base address + 0x070

FPN_ACC_DATA(7:0)							

FPN_ACC_R_WORKING <i>RO</i>	FPN ACCumulator Read WORKING						
	This field is the working status of the read-to-column accumulator. The data in the field FPN_ACC_DATA will be valid when FPN_ACC_R_WORKING is set to '0'						
Possible Values:	0x0	The data in the field FPN_ACC_DATA is valid					
	0x1	The data in the field FPN_ACC_DATA is invalid					

FPN_ACC_DATA (23:0) <i>RO</i>	FPN ACCumulator DATA						
	This is the column accumulator.						
Possible Values:		Any 24 bits value					

DPC_LIST_CTRL

Address: section "DATA" base address + 0x080

31	30	29	28	27	26	25	24
dpc_fifo_underrun	dpc_fifo_overrun	Reserved	dpc_fifo_reset	Reserved	dpc_firstlast_line_remove	dpc_pattern0_cfg	dpc_enable
23	22	21	20	19	18	17	16
Reserved		dpc_list_count(5:0)					
15	14	13	12	11	10	9	8
Reserved			dpc_list_WRn	Reserved			dpc_list_ss
7	6	5	4	3	2	1	0
Reserved		dpc_list_add(5:0)					

dpc_fifo_underrun <i>RO</i>							
	This is the fifo underrun status of the 2 linebuffers in the dpc macro. Write '1' then '0' to field dpc_FIFO_RST to reset this flag and reset the Fifo logic.						
Possible Values:	0x0	Underrun not detected					
	0x1	Underrun detected					

dpc_fifo_overrun <i>RO</i>							
	This is the fifo overrun status of the 2 linebuffers in the dpc macro. Write '1' then '0' to field dpc_FIFO_RST to reset this flag and reset the Fifo logic.						
Possible Values:	0x0	Overrun not detected					
	0x1	Overrun detected					

dpc_fifo_reset <i>RW</i>							
	Write '1' then '0' to field dpcL_FIFO_RST to reset overrun/underrun flags of the line buffers and reset the Fifo logic. The DPC dual port ram is not SW reset . The fifo in each processing DPC unit is HW reset at each SOF.						
Value at Reset:	0x0						
Possible Values:	0x0	Fifo in normal operation					
	0x1	Fifo in reset State					

dpc_firstlast_line_remove <i>RW</i>							
	When this register is set to 1, the DPC macro will remove the first and last line of the image corrected. This can be usefull if we want to correct the 4 pixels in the corners of the image. The SW can program two more lines in the frame so the DPC macro can have enough pixels to correct the 4 pixel coners.						
Value at Reset:	0x1						
Possible Values:	0x0	Do not remove any lines of the image received					
	0x1	Remove first and last line of the image received					

dpc_pattern0_cfg <i>RW</i>	This field configures the behaviour of the correction pattern 0x0. If this field is set to 0x0 then the current pixel will not be corrected. If this field is set to 0x1 then the current pixel will be replaced by the value 0x3ff (white pixel)	
Value at Reset:	0x1	
Possible Values:	0x0	Do not correct current pixel
	0x1	Replace current pixel by a white pixel (0x3ff)

dpc_enable <i>RW</i>	Dead Pixel Correction core Enable, when this field is set to 1, the DPC logic will correct all the dead pixels that are listed in the DPC list. The grab must be idle when changing this register.	
Value at Reset:	0x0	
Possible Values:	0x0	DPC logic is bypassed
	0x1	PDC logic is enable

dpc_list_count (5:0) <i>RW</i>	This is the number of entries in the DPC list. The driver need to set the dcp_list_count in order to correct the image. Up to 63 pixels can be corrected. The value 0 is allowed and when set to 0 no pixel will be corrected.	
Value at Reset:	0x0	
Possible Values:	Any Value	Any value from 0 to 63

dpc_list_WRn <i>RW</i>	This is the Write/ReadN flag. To write to the DPC list set this bit to 1 and start the transaction with the dpc_list_ss field. To read from the DPC list set this bit to 0 and start the transaction with the dpc_list_ss field.	
Value at Reset:	0x0	
Possible Values:	0x0	Read list operation
	0x1	Write list operation

dpc_list_ss <i>WO/AutoClr</i>	This is the DPC snapshot. In order to start a write or read transaction the snapshot needs to be written to '1'. This bit is a auto clear regisiter.	
Possible Values:	0x0	Do nothing
	0x1	Start the READ/WRITE transaction

dpc_list_add (5:0) <i>RW</i>	This is the address of the DPC list to be access by the read/write operation. Pixel 0 to correct is located at address b000000. Since the dpc_list_count field is also 6 bit wide, address 0 to 62 of the list can be used. Adress 0x3f cannot be used. This DPC location will not be corrected.	
Value at Reset:	0x0	
Possible Values:	0x0 - 0x3E	Valid DPC adress
